Move the Solution, Not the Problem

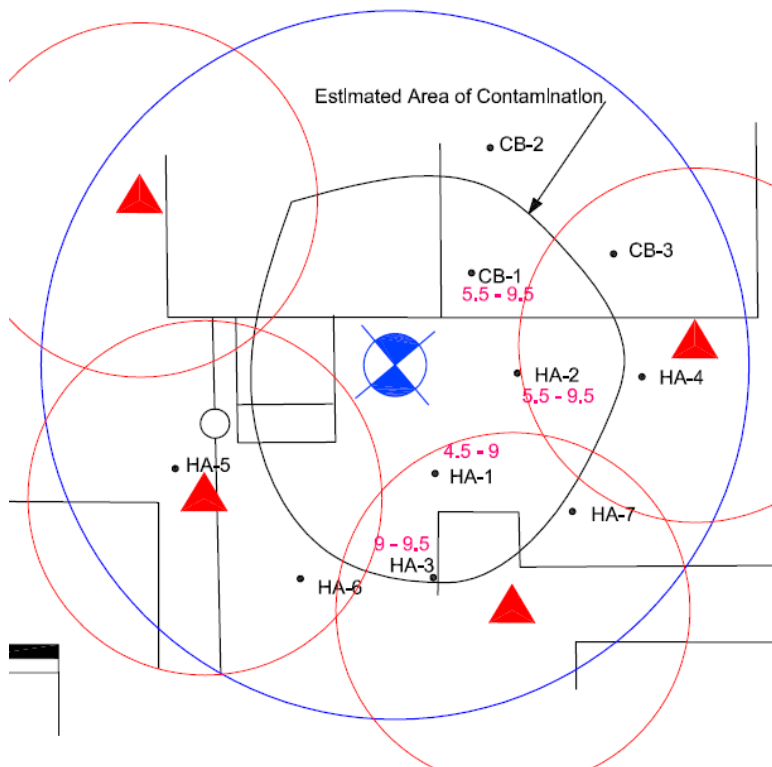

Completed Project-Home Heating Oil Remediation - Manasquan, New Jersey

During renovation and planning to build a deck to enhance the in ground pool, the new homeowners discovered an in ground tank had contaminated the yard behind the house. Assessment confirmed the contamination and that it was also beneath the residence toward the back wall. The initial treatment was with Steam Stripping, but was discontinued when there appeared to be unusual steam flow patterns, resulting in uneven heating. A modification was permitted to allow in-situ treatment with a Calcium Peroxide based injectant.

Three injection events were completed with a continuing low level residual in the groundwater. It appeared that there was a secondary source, possibly under the back edge of the house that continued to leach a very little contamination. A fourth treatment flooding the area around the footing of the house as well as the yard was successful.

Nano Peroxide injections to flood the entire area.

Steam injection/vapor extraction layout.

NFA was issued.
