

Continental Remediation LLC

Completed Project-Home Heating Oil Remediation - Rumson, New Jersey

Contamination from heating oil was previously treated with a combination of surfactant and oxidation compounds, introduced into the Reinfiltration Trench and recovered in the Extraction Trench. This process included a number of injection points in the cellar floor and two 6" recovery wells in the cellar floor.

Continental injected molecular oxidizer into the nine locations inside and flooded the recovery trench to insure any movement of groundwater would be toward the contaminated interior.

Subsiquent sampling allowed the site to be closed with an NFA.
